Grafana6.7.x汉化操作步骤(第二十一篇)

```
CentOs 7.6 x64
grafana汉化
第一步:安装nodejs和yarn, nodejs版本要大于12.0.0
如何安装nodejs和yarn?参考以下链接
https://yarn.bootcss.com/docs/install/#centos-stable
<a href="https://yarn.bootcss.com/docs/install/#centos-stable">https://yarn.bootcss.com/docs/install/#centos-stable</a>
或使用以下2条命令安装
# curl --silent --location https://dl.yarnpkg.com/rpm/yarn.repo
<a href="https://dl.yarnpkg.com/rpm/yarn.repo">https://dl.yarnpkg.com/rpm/yarn.repo</a> | tee /etc/yum.repos.d/yarn.repo
# curl --silent --location https://rpm.nodesource.com/setup_12.x
<a href="https://rpm.nodesource.com/setup_12.x">https://rpm.nodesource.com/setup_12.x</a> | bash -
# yum install -y nodejs
# yum install -y yarn
第二步: 到github (https://github.com/grafana/grafana/tree/v6.7.x
<a href="https://github.com/grafana/grafana/tree/v6.7.x">https://github.com/grafana/grafana/tree/v6.7.x</a>)上找到grafana源码
选择对应的分支,直接Dowload ZIP文件
第三步: 指定yarn源
yarn config set registry https://registry.npm.taobao.org < https://registry.npm.taobao.org > --
global
yarn config get registry
yarn config set sass_binary_site https://npm.taobao.org/mirrors/node-sass/
<a href="https://npm.taobao.org/mirrors/node-sass/">https://npm.taobao.org/mirrors/node-sass/</a> -g
第四步:安装依赖和构建
yarn install
yarn lint --fix
varn build
第五步:确认能编译成功(无报错),然后将编译后的目录同步到/usr/share/grafana/
备份/usr/share/grafana/public目录
mv /usr/share/grafana/public /usr/share/grafana/public.source
将当前编译目录下的public目录拷贝到/usr/share/grafana/
/bin/cp -rp public/ /usr/share/grafana/
重启grafana-server
systemctl restart grafana-server
```

第六步:汉化,然后重复第四、第五步。

windows 10设置编译环境

node下载: https://nodejs.org/en/ <https://nodejs.org/en/>

yarn下载: https://classic.yarnpkg.com/zh-Hans/docs/install#windows-stable

https://classic.yarnpkg.com/zh-Hans/docs/install#windows-stable

yarn config set registry https://registry.npm.taobao.org <https://registry.npm.taobao.org> -g

yarn config set sass_binary_site http://cdn.npm.taobao.org/dist/node-sass

http://cdn.npm.taobao.org/dist/node-sass -g

yarn config get registry

yarn build

注:在编译时,系统内存要大于4GB

以下是例出汉化"Preferences"和"Change Password"的几个页面路径。

登录页修改

app/core/components/Login/LoginForm.tsx

修改Change Password

app/features/profile/ChangePasswordPage.tsx

app/features/profile/ChangePasswordForm.tsx

修改偏好设置Preferences

app/features/org/SelectOrgCtrl.ts

app/core/components/SharedPreferences/SharedPreferences.tsx

app/features/admin/partials/edit_user.html

app/features/profile/ChangePasswordForm.tsx

按照上面的思路,基本可以完成Grafana各页面的中文化了。

但如果侧边菜单栏要中文化还需要修改Grafana源码中用go语言编写的代码。

第一步:安装go并设置环境变量

wget https://gomirrors.org/dl/go/go1.13.12.linux-amd64.tar.gz

https://gomirrors.org/dl/go/go1.13.12.linux-amd64.tar.qz

tar xvf go1.13.12.linux-amd64.tar.gz -C /usr/local

设置环境变量

export GOROOT=/usr/local/go

export PATH=\$PATH:/usr/local/go/bin

export GOPATH=/home/go/src

export GO111MODULE=on

export GOPROXY=https://goproxy.io

如下在克隆grafana时非常慢,可以

第二步:将下载下来的Grafana源码移到GOPATH对应路径下

##git clone https://gitee.com/mirrors/grafana.git < https://gitee.com/mirrors/grafana.git > cd \$GOPATH/src/github.com/grafana/grafana

第三步:编译

go run build.go setup go run build.go build

systemctl start grafana-server

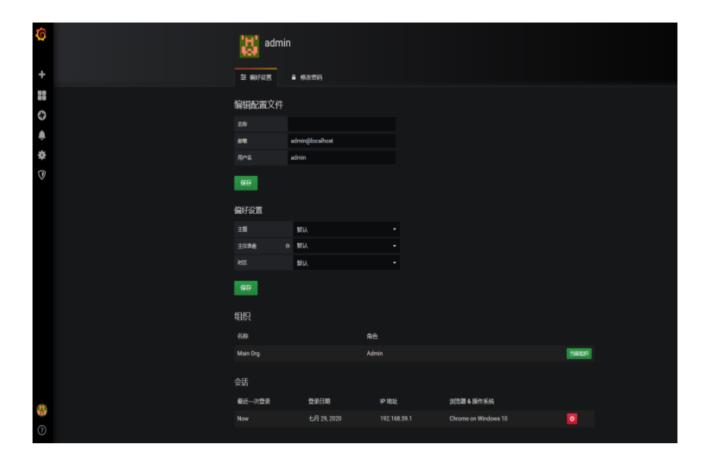

第四步:备份grafana-server二进制文件,并使用新编译的grafana-server二进制文件 mv /usr/sbin/grafana-server /usr/sbin/grafana-server.source systemctl stop grafana-server sleep 1 cp -rp ./bin/linux-amd64/grafana-server /usr/sbin/ sleep 1

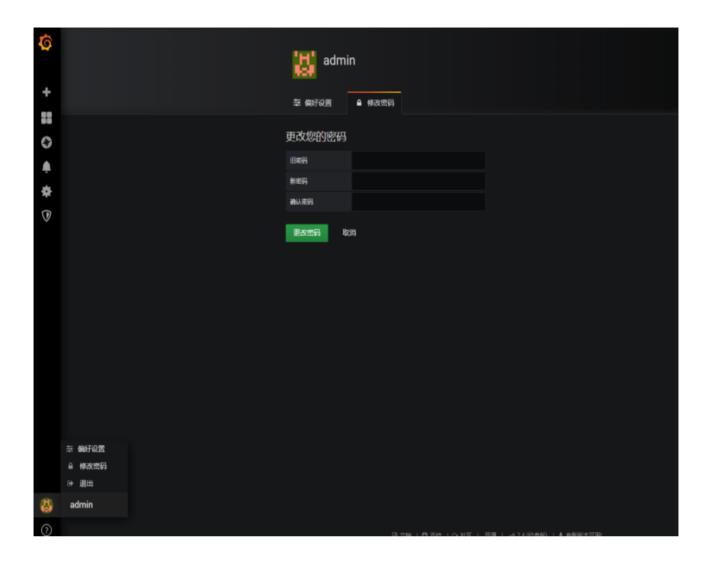

第五步:中文化go部分代码后,只需重复第三、四步。

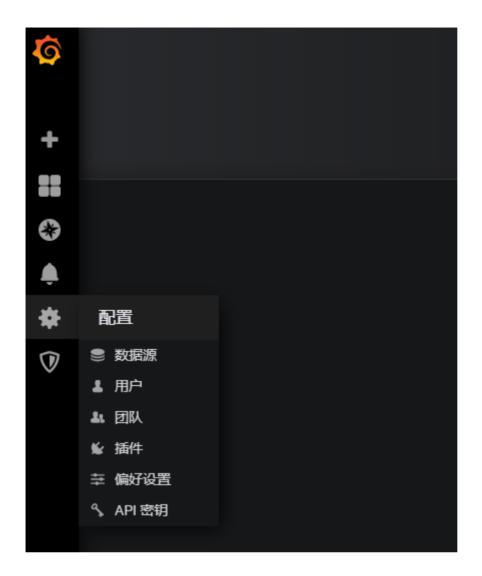

汉化效果截图
